The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 1, 3, 5, 6, 9, 11, 12, 15, & 16 are rejected under 35 U.S.C. 102(b) as being anticipated by Leven 5,273,022.

Leven shows a bow stabilizer including an elongated hollow rod 39, having a near end 40 for attachment to a bow, and a distal end having attached weights 46, 48, 50. Although Leven does not specify the exact weights of the rod and weights, he describes the rod as light weight (column 4, lines 32-34), and the weights appear relatively heavy, so the center of gravity of the rod-weight assembly would most likely be within 25 percent of the length from the distal end of the rod.

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been

Art Unit: 3712

obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 19-23, & 25-27 are rejected under 35 U.S.C. 103(a) as being unpatentable over Villa et al 5,390,656.

Villa shows a bow stabilizer including an elongated hollow rod 20 having a near end 24 for attachment to a bow, a distal end 26, and a weight 50 attached at the distal end. Although Villa does not specify the natural frequency of the first bending mode of the stabilizer, he points out that the frequency can be adjusted to match the vibrational characteristics of the bow, so it will more effectively absorb vibrations when the bow is fired, see column 2, lines 31-42; column 4, lines 40-49. If one had a bow with a vibration frequency of 20 Hz or 40 Hz, one would be able to adjust the stabilizer of Villa to match those frequencies. It would have been obvious to one of ordinary skill in the art to adjust the stabilizer of Villa to a frequency of at least 20 Hz or 40 Hz.

Claims 30-37 are allowed.

Claims 2, 4, 7, 8, 10, 13, 14, 17, 18, 24, 28, & 29 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form

Art Unit: 3712

including all of the limitations of the base claim and any intervening claims.

The prior art does not disclose a bow stabilizer including an elongated member having a near end for attachment to the bow, and a distal end; and a weight attached at the distal end, the weight having a mass which is at least 1.2 times the mass of the elongated member.

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.
